Hello Perk team,

The Suitcase role asks for three things I have done on a production system: run a contribution model that keeps experimental components out of the core library, track adoption with engineering, and move product teams from one component set to another.

At Abacum I co-led the Abax design system with the head of design across five squads. Components moved from exploration into the canonical library only after review in a weekly sync. New ones shipped behind feature flags, and each squad added its own migration tickets to move off MUI, so squads ran their own rollout. Frontend engineers counted Abax against MUI component uses every month. When I left, Abax accounted for about 47% of tracked component uses, with two squads through the form-element migration and a third partway.

At Remuner I was the only designer and built the system from scratch, starting with a small token set and ESLint rules that enforced use of system components. On the token pipeline I owned the design side, and used Codex to add CI validation, drift detection and smoke tests through PRs that engineers reviewed and merged. At Remuner I also used the Figma MCP with an AI agent to keep tokens in sync with code and to check colour contrast and design-code parity. I still work that way, now with Claude.

Both systems are written up at manel-leiva.com/cases/design-systems.

Best,

Manel
