

Dear Hiring Team,

I designed and shipped the AI agent at Remuner, a chat surface where sales reps and managers ask financial questions in plain language: commission data, sales plans, team numbers. I owned the conversation design and the trust patterns, deciding what the agent answers, what it declines, and how it signals uncertainty. QuantPilot's job, translating trading logic into something a non-technical trader trusts, is the same design problem at a different data layer.

Before that, at Abacum, I standardised the formula syntax across an FP&A modeling layer and designed the Dataset Manager, a UI layer that let finance teams configure their own data without engineering support. Letting a non-technical trader configure a DCA or grid bot without engineering is the same problem. I also run DCA bots on Kraken myself, so the mechanics aren't new territory.

Happy to walk through both: manel-leiva.com.

Best,
Manel
