

Dear Hiring Team,

At Abacum I built the Abax design system, adopted across five squads. Contribution ran through a structured issue-reporting system with its own naming-proposals track, and new components shipped under feature flags so squads added their own migration tickets instead of waiting on a central team. I also designed the Dataset Manager, letting finance teams configure their own data without engineering support.

At Remuner I was the sole designer for two years, owning the product surface and the design system, including a token pipeline from Token Studio to a published npm package. I also ran an ongoing audit throughout tenure: capture every inconsistency in the product, define its variants and states, then decide whether to fix it now or defer it into an upcoming feature.

I haven't worked in agribusiness. I have spent years in the same kind of problem: internal tools that need to work for people who aren't designers, built and governed by a small team. Happy to walk through the fit: manel-leiva.com.

Best,
Manel
