

Dear Hiring Team,

At Remuner I built the design system from scratch as the sole designer: component architecture, Figma variables, and a token pipeline from Token Studio through Style Dictionary to a published npm package, hardened with AI-assisted drift checks and smoke tests. The CTO's unprompted verdict was that the product went from a 2010 app to a 2020 app. The case is live at manel-leiva.com/cases/design-system-remuner.html.

Before that I built the Abax system at Abacum, a two-tier token architecture adopted across five squads. Contribution ran through a structured issue-reporting system with its own naming-proposals category, and new components shipped under feature flags so squads added their own migration tickets instead of waiting on a central team. Adoption targets were set up front and tracked by counting components in the codebase. Your contribution model reads like the same approach at a bigger scale.

OLX's design system spans multiple product tribes. That's the scale problem I want next. Happy to walk through the fit.

Best,
Manel
