

Dear Hiring Team,

I've been working on the same problems Wayflyer describes: financial products where dense data and complex workflows have to feel effortless. At Abacum, an FP&A platform, I standardised the formula syntax finance teams used to build models, and designed the Dataset Manager, a UI over JSON configuration that let them set up their data without engineering support.

At Remuner I was the sole designer on a sales compensation platform. I designed and shipped an AI agent where sales reps and managers consult their commission data and sales plans, released to all customers. I also built the design system and its token pipeline, from Figma tokens to a published npm package. AI is part of my daily practice; I prototype in Figma Make and used AI assistance to harden the pipeline, with engineers reviewing the work.

I work remotely from Barcelona. Portfolio: manel-leiva.com.

Best,
Manel
