

Dear Hiring Team,

I designed the AI agent at Remuner that shipped to every customer: a chat panel plus embedded answers where sales reps and managers consult their commission data and plans. I owned the conversation design and the trust patterns, deciding what the agent answers, what it declines, and how it signals uncertainty. After release I iterated on tone and answer formats, and adapted terminology per customer.

The AI Lab setup, one designer working with twelve engineers, is the mode I know. At Remuner I was the sole designer across the whole product. Before that, at Abacum, I designed the dataset configuration layer of an FP&A platform. I prototype with Claude-based tooling daily, and I built the design system side too: a token pipeline from Figma to a published npm package.

Happy to go deeper on the agent work: <https://manel-leiva.com>.
