

Dear Spendesk team,

I'm applying for the Confirmed Product Designer role because the problems you're working on sit very close to the kind of product design I've been doing: complex B2B workflows, data-heavy products, AI-assisted experiences, and systems that need to work consistently across a growing product.

At Remuner, I designed and shipped an AI agent that is now available to all customers. I worked closely with Product and Engineering on what the agent should be able to do, how it should communicate its answers, and how to make the experience trustworthy when users are working with business-critical commission and sales data. As the sole designer, I also owned the wider product experience and design system.

Before that, at Abacum, I worked on data and modelling workflows for finance teams. I designed a dataset management experience that allowed finance users to configure data without relying on engineering, and worked with an engineer to establish a consistent formula syntax for the modelling layer. I also helped establish the business case for the design system and built its token and component architecture, which was adopted across five squads.

The design-system aspect of the role is particularly relevant to my experience. I've built systems not just as collections of components, but as a connection between design and implementation: token architecture, automated pipelines, published packages, and shared standards that engineers and designers can work with consistently.

I'm based in Barcelona and am comfortable working in a hybrid product team. I'd be interested in discussing how my experience with complex financial workflows, AI products and design systems could contribute to Spendesk.

Best,

Manel Leiva
