Hello Datavant team,

The Provider Console role caught my attention because the central problem is familiar: making complex tools feel like one coherent product while helping professional users complete more work without relying on internal teams.

At Abacum, I led design and customer testing for the Dataset Manager, a guided interface over JSON-based configuration. Finance teams could configure and manage their own data instead of depending on implementation support for routine changes. The implementation team's read was that standard configuration took roughly half the previous time, and customers could reach a working setup in their first session.

I also worked across the systems surrounding that experience. I helped bring the datasets and modeling layers toward a more consistent language, and built the Abax design system across five squads. More recently, as the sole designer at Remuner, I owned design across the product and ran a systematic audit to align patterns, states, and components with engineering.

The combination of self-service, platform architecture, research, and cross-product consistency is what makes this role especially relevant to me. I am based in Barcelona, and the two-day hybrid schedule in Gràcia works for me.
