Hello Kabilio team,

Kabilio caught my attention because you are bringing accounting, tax, payments, planning, and banking into one platform for accounting firms and SMEs. That is close to the work I have been doing in financial software, where the interface has to make complex data and business rules understandable without hiding how the system works.

At Abacum, I led design and customer testing for the Dataset Manager. Finance teams had been relying on implementation support to configure their data through JSON. The research showed that the interface spoke in technical data types and schemas while users thought in dimensions, mappings, and column formats. I helped turn that underlying system into a guided workflow that customers could use themselves.

More recently, I was the sole designer at Remuner, a B2B sales-compensation platform. I worked directly with founders and engineers across the product, maintained its design system, and designed an AI agent for questions about commissions and sales plans. My work covered the interface, conversation design, answer formats, capability boundaries, and trust patterns.

I would be glad to bring that mix of financial-product experience, research, interaction design, and close engineering collaboration to Kabilio as you expand the platform and introduce AI into more workflows.

You can see the closest case here:
