Hello OLX team,

Your Senior Product Designer role caught my attention because it combines AI product design, working prototypes, and the systems that support implementation across teams.

At Remuner, I owned product design across the sales-compensation platform as its sole designer. I designed and shipped a conversational AI agent, owning conversation design, answer formats, and trust patterns, with capability decisions shared with founders and engineering. I also built interactive prototypes through AI-assisted workflows for user testing and used Codex to improve the token pipeline through engineering-reviewed PRs.

My product work also involved investigating why users misunderstood commission information. Interviews identified gaps around plan calculations and payout timing; I designed changes that shipped, and user testing showed users understood the information they had previously been missing.

At Abacum, I worked across data integrations and financial modeling and co-led the design-system business case with the head of design. My systems work covered components, tokens, governance, and the engineering pipeline across five squads. I also introduced agendas and rotating hosts for design-team meetings. Across my career, I have mentored designers and taught UX, components, and WordPress themes.
