Dear RemoFirst team,

I’m applying for the Senior Product Designer role because the problems you’re solving sit close to the kind of product design work I’ve focused on throughout my career: making complex workflows understandable and usable while balancing customer needs, product goals and technical constraints.

Most recently at Remuner, I designed and shipped a production AI agent used by sales reps and managers to work with commission data, sales plans and team information. I owned the interaction and conversation design, including capability scoping, response formats, and trust and accuracy patterns, working closely with Product and Engineering.

Previously at Abacum, I worked on complex data workflows for finance teams. I designed Dataset Manager, a product layer over JSON configuration that allowed finance teams to manage their data without engineering support, and helped standardise the formula language used across the modelling layer. This work involved customer feedback, competitor research and close collaboration with Engineering to make complex underlying systems easier to use.

I also bring experience building design systems and working as a sole designer, giving me a strong understanding of both product-level decisions and the practical realities of getting them into production.

I’d be interested in bringing this combination of product thinking, complex workflow design and AI interaction experience to RemoFirst.

Best,
Manel Leiva
