Hello Stripe team,

I'd like to join Sail because I want to spend more of my time on the details that make a design system useful: how components behave, how they're documented, and how closely the implementation matches the design. I've done this alongside broader product work at Abacum and Remuner, and the opportunity to focus on it within a dedicated team appeals to me.

At Abacum, I helped build and maintain Abax across five product squads. I worked on the Figma library and token architecture, then ran the weekly library sync and contribution process as teams migrated their products onto the system.

At Remuner, I built the component library as sole designer and kept improving it through a product audit. That meant reviewing existing screens, defining missing states and variants, and agreeing with engineers on what to fix next. I also used Codex to improve the token pipeline with validation checks and an HTML preview, through PRs reviewed and merged by engineers.

I'd bring that hands-on experience to Sail, along with a background in HTML, CSS, and building interfaces. I'm interested in learning how your designers and engineers approach component decisions across Stripe's products and contributing to that work.

You can see both systems here:
