Dear eDreams team,

I’m applying because this role sits close to the work I’ve been doing: making complex, data-heavy workflows easier to navigate, and designing AI interactions people can trust.

At Remuner, I designed and launched a conversational AI agent for sales-compensation questions. I defined what it could answer, how it explained calculations, and when it should refuse to answer. We tested formats with users before launch, then reviewed feedback and conversations weekly to improve clarity and trust.

Before that, at Abacum, I designed self-serve data tools for finance teams. We replaced JSON-based configuration with guided workflows that reduced reliance on implementation support and helped users reach a working setup faster.

I’m particularly interested in the intersection of customer and agent experience: the systems, business rules, and edge cases behind a service.

Best,
Manel Leiva
