

Dear Hiring Team,

Bitpanda Fusion caught my attention for a specific reason. The challenge of taking expert trading concepts like order books, depth of market, and real-time analytics and turning them into interfaces that support fast, confident decision-making is exactly the kind of problem I find most interesting.

My background is in fintech interfaces where the data is dense and the consequences of a wrong decision are real. At Abacum I designed the formula expression interface for FP&A model creation. The users were financial modellers who needed precision and auditability in every interaction. Getting the syntax wrong meant broken models. The work required understanding how expert users think under pressure and designing for that, not against it. At Remuner I designed real-time commission dashboards for multiple user roles, each needing different data density and different decision triggers from the same underlying data source.

I also invest in crypto myself. I use Kraken, DCA regularly, and have spent enough time inside trading interfaces to know where they lose non-expert users and where they frustrate expert ones. That perspective informs how I think about making complex concepts accessible without stripping out the precision that experienced traders depend on.

The most relevant cases are at <https://manel-leiva.com/cases/modeling-syntax> and <https://manel-leiva.com/cases/dataset-manager>. Happy to walk through either in more detail.
