

Dear Hiring Team,

This role caught my attention because of the problem space. Helping employees be productive from day one, across onboarding, permissions, equipment, and support, are workflows that most companies struggle to handle. There's real room to get them right.

I've done this kind of work before. At Remuner I joined as the first and only designer with no existing practice, no components, no documented patterns. I built the discipline from scratch while shipping product: multi-step approval workflows, role-based permission systems, data mapping flows. The design system came in parallel, not after. At Abacum I was the first designer on the integrations squad, taking a back-office tool used only by the implementation team and turning it into something enterprise finance teams could use on their own.

What I find most relevant about this role is that it's not just about shipping features. It's about setting the foundations: the patterns, the standards, the way design works inside a team that doesn't have that yet. That's work I find genuinely motivating, and I have direct experience doing it.

The most relevant case is at <https://manel-leiva.com/cases/dataset-manager>. Happy to walk through both that and the Remuner work in more detail.
