

Dear Hiring Team,

Typeform's integrations role caught my attention for a specific reason. The problems you are describing like the unified setup flows, connection management across product surfaces and reusable patterns that scale, are close to what I spent two years on at Abacum.

I was the first designer on the integrations and datasets squad. The starting point was a JSON editor that only the implementation team could use. By the time I left, finance teams were connecting data sources from different integrations, defining transformations, and configuring column types on their own, without filing a support request or waiting for engineering. Getting there meant understanding two very different user types: the implementation team who knew the system inside out, and the finance users who needed it to feel nothing like a back-office tool. The challenge was designing for both without creating two separate experiences.

That kind of problem sits at the intersection of platform thinking and user empathy, which is exactly where this role lives. I'm also comfortable contributing to design systems rather than just consuming them. At both Abacum and Remuner I built and maintained the systems the product teams worked from, so I understand the cost of inconsistent patterns and how to fix them without disrupting ongoing work.

The integrations work is at <https://manel-leiva.com/cases/dataset-manager>. Happy to walk through it in more detail.
